cplace

Keep track of changes

Changes

premium applications
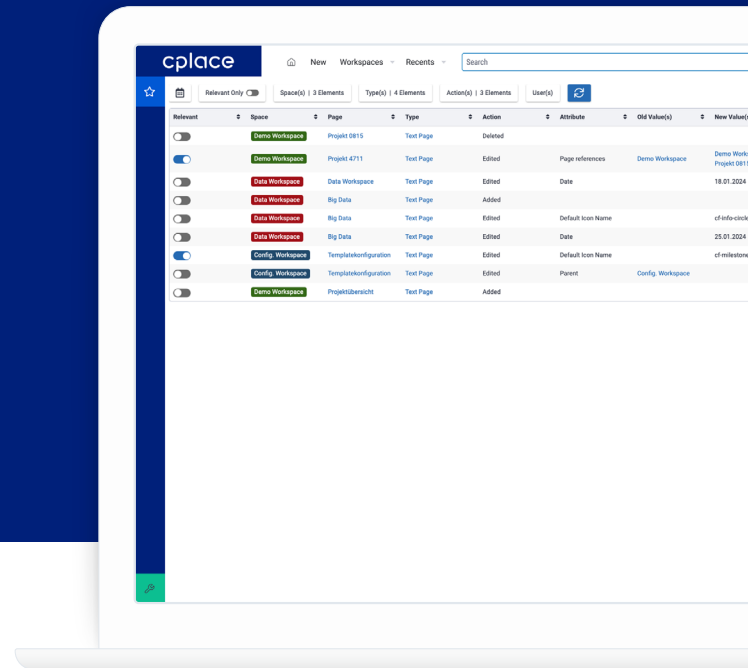

Change is a daily occurrence when working on a project. Deadlines are pushed back, budgets are adjusted, and responsibilities are shifted. It's easy to lose track, especially during hectic phases. The Premium Application **Changes** helps you to keep track of all changes at any time.

The Premium Application **Changes** clearly lists all changes made in the cplace system.

Depending on the context it is easy to configure which changes should be displayed. For example, you can filter by time period, content or change type with just a few clicks.

Filter options: Filter down to the content that interests you with just a few clicks

There and gone: List not only modified pages, but also deleted or added pages

All in one place: Changes from different parts of the system are bundled in one place

Business Challenge

The holidays are over and the first emails after the absence have been answered. But in the last few weeks, what has actually happened in my project? With **Changes** you can quickly find out what has happened. The filters for time period and work area are set and lo and behold: the big milestone was reached on time. This way you can get the week off to a relaxed start.

Customer Benefits

The Premium Application **Changes** summarizes what you would otherwise have to search for in detail in the page histories. Find all standard historical data and more - such as deleted data - in an overview that you can configure for specific applications and filter according to the situation.

Special Features

1. Relevance: You can mark important changes as relevant. To do this, simply activate the slider in the appropriate row. This change will now appear as relevant to you and others when you filter for relevant changes.

2. Export: Want to keep your changes versioned? With the export function, you can easily export the change table to Excel. Filters are part of the export process.

3. Privacy: **Changes** displays all changes to the user. This includes metadata such as author and time. With great power comes great responsibility. In the system settings, you can centrally control which users and user groups are allowed to see the changes in **Changes**.
