Scaling agile working methods successfully

# Essential SAFe

solution templates

The cplace Solution Template **Essential SAFe** supports companies in scaling agile working methods. It offers digital support for the basic configuration of the Scaled Agile Framework (SAFe). The Solution Template shows the typical artifacts in a structured way and helps people work together to manage them.

It also provides insights into who is working on what and how that work is progressing. This includes managing the Agile Release Train (ART) of a SAFe program. It involves managing the Program Backlog, breaking it down into stories for the individual teams, and highlighting existing dependencies.

It also helps with Program Increment (PI) Planning and with keeping track of progress.

Visualization, prioritization, and management of the features in the Program Board

Progress control through visualization of KPIs, program and PI statistics

Identification of dependencies and potential conflicts at a glance

Business Challenge

Companies in agile and digital transformation processes face the challenge of scaling agile working models beyond the level of individual teams. Those responsible must align a "Team of teams" of often more than 100 people with common goals, synchronize all participants, and bring them into a common timeframe.

Customer Benefits

The Solution Template creates transparency across a SAFe program. Powerful visualizations make upcoming tasks and milestones, dependencies and potential conflicts as well as the current progress tangible for all team members. In addition, it supports managers in the practical organization of meetings, events and release dates.

Special Features

1. Transparency at a glance through powerful visualizations: The Program Kanban allows users to organize and manage Program Features on an agile board. The Program Roadmap shows the Program Increments (PI) with releases, SAFe milestones, features, and dependencies on a timeline.

2. Effortless organization: The Solution Template supports PI management - the preparation and execution of PI planning. It also provides an overview of all Program Increments with a calendar view, the corresponding SAFe milestones, and a meeting organizer.

3. All information in one place: All stakeholders will find relevant information around the Agile Release Train (ART) and the regarding responsibilities, teams, canvas, and process at a central, accessible location. It is also the place where users can manage all features, including their priorities, dependencies, and the resolution of potential conflicts.
