cplace

## Successfully manage project risks in a team

# Risk Manager

solution templates

The cplace *Solution Template Risk Manager* combines the most successful methods for collating, evaluating, and managing project risks. An integrated agile action management helps to control and minimize project risks.

Customizable workflows guide project team members through the required steps in an easy-to-understand manner. This way, companies open risk management to new user groups and enable them to efficiently control risks in the project. Target group-specific dashboards provide the necessary transparency.

The *Risk Manager* works in flexible interaction with all other cplace apps and solutions (such as Collaborative Project Scheduling and Portfolio Management) on a common data basis.

Active involvement of all stakeholders through networked risk management

Agile management of risk mitigation measures

Compliant historization and archiving of relevant information

Business Challenge

Innovation cycles are becoming shorter and shorter, while product development is becoming more complex. It must function globally in interaction with a large number of suppliers. This leads to an increase in project risks, while at the same time transparency decreases. Risks that are discovered too late and are not adequately managed endanger the success of the entire project, be it through delays in the project process or through insufficient quality of the project results.

Customer Benefits

With the Risk Manager, cplace offers companies a lean, intuitive solution that integrates all relevant stakeholders into the project or company-wide risk management. This allows all project participants, even in distributed teams, the greatest possible transparency and coordinated action in the planning and implementation of measures.

Special Features

1. Flexibly adaptable workflows guide the various user groups through defined risk management processes. All important risk information is shared across the project or company, supplemented by agile action management. A powerful rights and roles concept ensures the security of sensitive data.

2. The automatic historization of all risk information as well as the flexible archiving of report statuses ensure compliant data management. Current and historical information can be evaluated live in dashboards as well as in flexibly customizable reports.

3. Authorized users can implement adaptations to individual and changing requirements themselves at any time, even without programming knowledge thanks to cplace No-Code and Low-Code. This means that workflows and dashboards can be continuously improved, and Lessons Learned from risk management can be implemented directly in the system.
