

Next-Generation Resource Management

How resource management becomes your success factor

Projects are becoming increasingly **complex and interdisciplinary**. Cross-functional initiatives in which several departments work together are now the rule rather than the exception. This development presents companies with particular challenges in resource management.

Companies need a **central resource pool** and **standardized processes** to be able to plan, control and evaluate company-wide. This gives them transparency about all available capacities. **Operational and strategic decisions** can be made with confidence **based on this reliable information**.

On the other hand, each department has its own, established working methods and associated **specific requirements for a resource management solution**. If these individual requirements are not considered, acceptance of the tool drops drastically - employees return to their Excel planning to shadow IT.

Another challenge lies in the **different levels of maturity of resource management** within an organization. Nevertheless, everyone should be able to work with the same central solution.

The answer is **next-generation resource management** that builds bridges and unites opposites: on the one hand, central standards with uniform processes and a single source of truth, and on the other, **maximum flexibility** to map internal company processes and implement specific requirements.

The Downward Spiral in Resource Management

Planning in Excel & Co.

- Silo application without connection
- Easy to use and customizable
- High manual maintenance effort

Rigid enterprise tools

- Central “one size fits all” solution
- Software provides rigid standard processes
- Hardly customizable

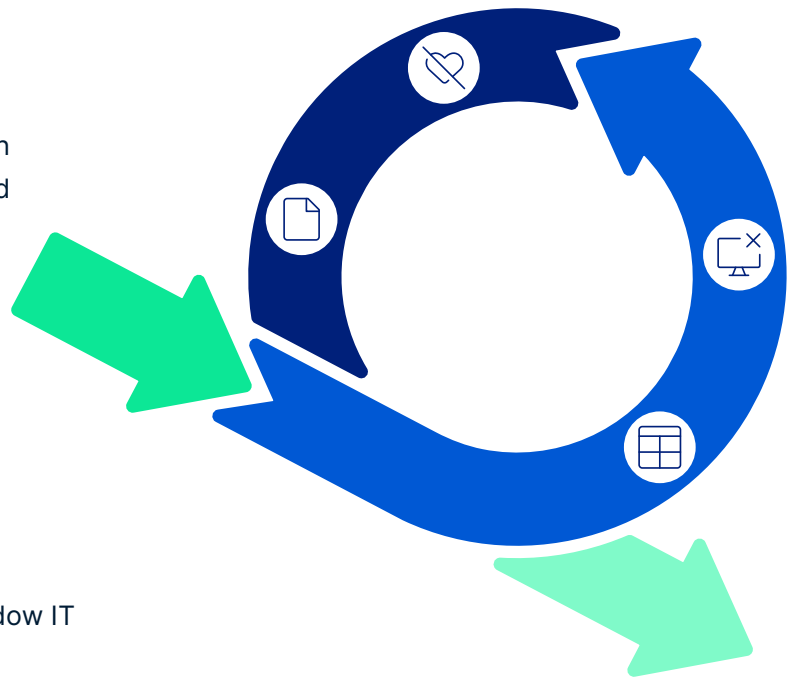

Rejection by users

- Little benefit for end users
- Unsuitable standard processes
- Poor usability

Back to planning in Excel & Co.

- Return to silo application in shadow IT
- Enterprise tool is hardly used
- Poor data quality in the enterprise tool

Next-Generation Resource Management

cplace is the unique platform for resource management that combines the **advantages of individual software** with the **strengths of a standard enterprise solution**. As a result, cplace is revolutionizing the way in which companies can optimally deploy their most valuable resources – their employees.

Flexibility increases added value

On the cplace platform, companies design their resource management standards and processes exactly as they need them.

cplace fully maps these processes. It also allows the company the flexibility to **make extensions or adjustments itself** if required.

This gives the individual departments tangible added value that **makes their day-to-day work easier**. The company as a whole also benefits in the form of a single source of truth, which forms the basis for **quick and reliable decisions** on the use of resources

Adaptive resource management – Implementing adaptations yourself with Citizen Development

Behind the term “Citizen Development” is the idea of having the specialist departments carry out adaptations to business applications themselves. This not only relieves the burden on IT, but also increases the quality of the application through direct specialist input.

cplace offers users with no (no-code) or little (low-code) programming knowledge the opportunity to adapt the individual solution modules of the platform and processes.

Immediately productive, but still individual

Teams in the company work according to different methods and need a solution that provides them with the best possible support for their individual challenges. Resource management must also fit in with this. By using **ready-to-use building blocks** that can be **easily combined and modified**, companies can start being productive straight away.

Thanks to clear dashboards, utilization charts and reports, organizations can use cplace to find the **optimal balance between available capacities and project requirements**.

One platform for all resource decisions

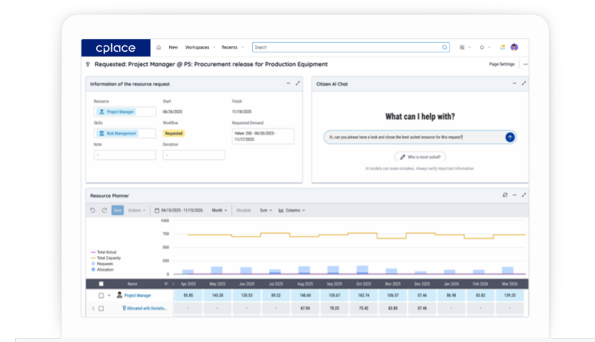

cplace offers a comprehensive platform for resource decisions across all areas of the company. For the first time, organizations gain a unified view of the different departments in the company and significantly **reduce the coordination effort between project and line**. The integration of all resource data puts an end to process and media disruptions between different tools and creates a reliable database.

From resource allocation to strategic personnel planning

cplace covers the entire spectrum of resource management: from simple **task management** and **resource allocation** in projects at department, skill or role level to a **strategic view of resource planning** in portfolios across the entire organization.

AI - the turbo for your resource management

The potential of artificial intelligence is constantly growing. Next-Generation Resource Management from cplace provides users with **AI as an assistant** that supports them in a variety of tasks if required. For example, the AI helper finds suitable employees for resource allocation for all tasks that require a specific skill and role profile, helps to prioritize tasks or creates suitable visualizations for workload analyses.

Secure, integrated and scalable – at enterprise level

cplace is used by numerous market-leading companies from various industries. cplace meets the requirements of large companies in terms of centralized data storage, role and rights concepts, data and information security as well as support and maintenance capability.

In addition, cplace offers **secure, scalable integration into the existing IT landscape**. The platform enables simple data exchange with a wide range of existing systems, including SAP, Microsoft Office and Jira.

At the same time, cplace provides users with exactly the information that is relevant to them according to their user role, e.g. as capacity utilization in a dashboard, as a task in a task list or as an aggregated key figure for management.

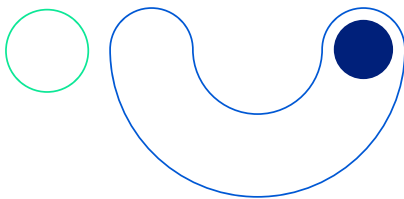

Data-informed decisions instead of gut feeling

With cplace, you can identify resource bottlenecks before they occur. Make portfolio decisions with real-time insight into resource availability and plan the optimal mix of internal capacities and external service providers in the long term. Optimize the utilization of your teams without overloading individual employees.

Organizations waste approximately 10 % of every dollar invested in projects due to poor resource allocation and planning, with inadequate resources consistently cited as a primary cause of project failure.
