

cplace

Integrate agile task management
into enterprise planning worlds

Enterprise Board

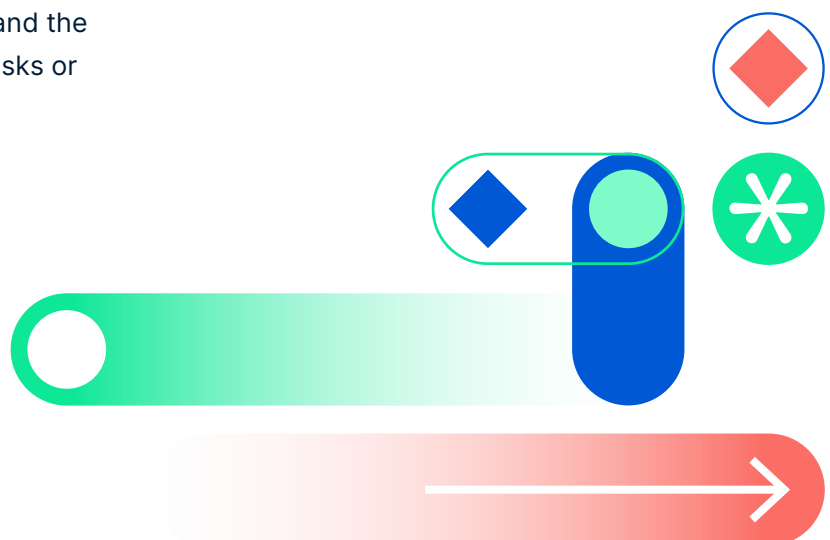

The cplace Enterprise Board offers users a solution for agile task management that integrates seamlessly into an overall enterprise software solution. The board can be individually tailored to a variety of use cases and process logics.

Users have a wide range of configuration options: They can freely define the underlying methodology (e.g., Scrum or Kanban), the enterprise level (e.g., team or department), and the content managed in the board, (e.g., tasks or actions).

In addition, hybrid project management models are supported by linking the board content with elements of the classic planning world in the cplace Enterprise Scheduling. This will help ensure a comprehensive management of all planning elements.

→ More at cplace Universe

Various application scenarios from task to shopfloor to campaign management

Use of any agile methods in combination with traditional project management methods

Supplementation with validation mechanisms and workflows

Business Challenge

Many rigid enterprise solutions lack suitable task management systems for agile teams. As a result, they fall back on alternatives and thus lose the link with higher-level corporate planning. The result is often a shadow IT, leading to poor data quality, lack of transparency, and lack of speed.

Customer Benefits

The benefits of the board are as diverse as its possible application scenarios. Any planning elements in cplace can be broken down into controllable units and managed in an agile way on the board. This approach ensures that links to higher-level planning are retained, agile teams are not restricted in their working methods, and hybrid project management concepts are supported.

Special Features

1. It is possible for the board to reflect different agile methods, as well as to combine agile with classic project management approaches. For example, agile tasks can be linked with milestones in a traditional project plan and managed within the framework of hybrid project management.
2. Thanks to a wide range of configuration options and a comprehensive authorization concept, the board can be individually tailored to a large number of use cases. Among other things, campaign management, sales funnels, digital shopfloor management or Kanban boards can be represented and provided with validation mechanisms and workflows.
3. The board blends in seamlessly with the other cplace solutions and building blocks and thus supports the integration of agile teams into a comprehensive enterprise software platform.
